# 1 Introduction To Algorithm Design

the algorithmic *problem* known as *sorting* is defined as follows:

*Problem:* Sorting

*Input:* A sequence of  $n$  keys  $a_1, \dots, a_n$ .

*Output:* The permutation (reordering) of the input sequence such that  $a'_1 \leq a'_2 \leq \dots \leq a'_{n-1} \leq a'_n$

```

I|N S E R T I O N S O R T
I N|S E R T I O N S O R T
I N S|E R T I O N S O R T
E I N|S R T I O N S O R T
E I N R|S T I O N S O R T
E I N R S|T I O N S O R T
E I I N R S T|I O N S O R T
E I I N R S T|O N S O R T
E I I N O R S T|N S O R T
E I I N N O R S T|S O R T
E I I N N O R S S T|O R T
E I I N N O O R S S T|R T
E I I N N O O R R S S T|T
E I I N N O O R R S S T T

```

Figure 1: Animation of insertion sort in action (time flows down)

```

insertion_sort(item s[], int n)
{
    int i,j; /* counters */

    for (i=1; i<n; i++) {
        j=i;
        while ((j>0) && (s[j] < s[j-1])) {
            swap(&s[j], &s[j-1]);
            j = j-1;
        }
    }
}

```

Figure 2: A good instance for the nearest neighbor heuristic

## 1.1 Robot Tour Optimization

*Problem:* Robot Tour Optimization

*Input:* A set  $S$  of  $N$  points in the plane.

*Output:* What is the shortest cycle tour that visits each point in the set  $S$ ?

## 1.2 Selecting the Right Jobs

*Problem:* Movie Scheduling Problem

*Input:* A set  $I$  of  $n$  intervals on the line.

*Output:* What is the largest subset of mutually non-overlapping intervals which can be selected from  $I$ ?

*Take-Home Lesson:* Reasonable-looking algorithms can easily be incorrect. Algorithm correctness is a property that must be carefully demonstrated.

## 1.3 Reasoning about Correctness

### 1.3.1 Expressing Algorithms

*Take-Home Lesson:* The heart of any algorithm is an *idea*. If your idea is not clearly revealed when you express an algorithm, then you are using too low-level a notation to describe it.

### 1.3.2 Problems and Properties

*Take-Home Lesson:* An important and honorable technique in algorithm design is to narrow the set of allowable instances until there *is* a correct and efficient algorithm. For example, we can restrict a graph problem from general graphs down to trees, or a geometric problem from two dimensions down to one.

### 1.3.3 Demonstrating Incorrectness

- *Verifiability*
- *Simplicity*
- *Think small*
- *Think exhaustively*
- *Hunt for the weakness*
- *Seek extremes*

*Take-Home Lesson:* Searching for counterexamples is the best way to disprove the correctness of a heuristic.

### 1.3.4 Induction and Recursion

*Take-Home Lesson:* Mathematical induction is usually the right way to verify the correctness of a recursive or incremental insertion algorithm.

### 1.3.5 Summations

- *Arithmetic progressions*
- *Geometric series*

## 1.4 Modeling The Problem

### 1.4.1 Combinatorial Objects

- *Permutations*
- *Subsets*
- *Trees*
- *Graphs*
- *Points*
- *Polygons*
- *Strings*

*Take-Home Lesson:* Modeling your application in terms of well-defined structures and algorithms is the most important single step towards a solution.

### 1.4.2 Recursive Objects

- *Permutations*
- *Subsets*
- *Trees*
- *Graphs*
- *Points*
- *Polygons*
- *Strings*

## 1.5 About the War Stories

## 1.6 War Story: Psychic Modeling

# 2 Algorithm Analysis

Our two most important tools are

1. *The RAM model of computation*
2. *The asymptotic analysis of worst-case complexity*

## 2.1 The RAM Model of Computation

*Take-Home Lesson:* Algorithms can be understood and studied in a language and machine-independent manner..

### 2.1.1 Best, Worst, and Average-Case Complexity

Figure 3: Best, Worst and average case complexity

## 2.2 The Big Oh Notation

Figure 4: Upper and lower bounds valid for  $n > n_0$  smooth out the behavior of complex functions

Figure 5: Illustrating the big (a)  $O$ , (b)  $\Omega$ , and (c)  $\Theta$  notations

### Stop and Think: Hip to the Squares

*Problem:* Is  $(x + y)^2 = O(x^2 + y^2)$

### Stop and Think: Back to the Definition

*Problem:* Is  $2^{n+1} = \Theta(2^n)$ ?

## 2.3 Growth Rates and Dominance Relations

$n$	$f(n)$	$\lg n$	$n$	$n \lg n$	$n^2$	$2^n$	$n!$
10		0.003 $\mu\text{s}$	0.01 $\mu\text{s}$	0.033 $\mu\text{s}$	0.1 $\mu\text{s}$	1 $\mu\text{s}$	3.63 ms
20		0.004 $\mu\text{s}$	0.02 $\mu\text{s}$	0.086 $\mu\text{s}$	0.4 $\mu\text{s}$	1 ms	77.1 years
30		0.005 $\mu\text{s}$	0.03 $\mu\text{s}$	0.147 $\mu\text{s}$	0.9 $\mu\text{s}$	1 sec	$8.4 \times 10^{15}$ yrs
40		0.005 $\mu\text{s}$	0.04 $\mu\text{s}$	0.213 $\mu\text{s}$	1.6 $\mu\text{s}$	18.3 min	
50		0.006 $\mu\text{s}$	0.05 $\mu\text{s}$	0.282 $\mu\text{s}$	2.5 $\mu\text{s}$	13 days	
100		0.007 $\mu\text{s}$	0.1 $\mu\text{s}$	0.644 $\mu\text{s}$	10 $\mu\text{s}$	$4 \times 10^{13}$ yrs	
1,000		0.010 $\mu\text{s}$	1.00 $\mu\text{s}$	9.966 $\mu\text{s}$	1 ms		
10,000		0.013 $\mu\text{s}$	10 $\mu\text{s}$	130 $\mu\text{s}$	100 ms		
100,000		0.017 $\mu\text{s}$	0.10 ms	1.67 ms	10 sec		
1,000,000		0.020 $\mu\text{s}$	1 ms	19.93 ms	16.7 min		
10,000,000		0.023 $\mu\text{s}$	0.01 sec	0.23 sec	1.16 days		
100,000,000		0.027 $\mu\text{s}$	0.10 sec	2.66 sec	115.7 days		
1,000,000,000		0.030 $\mu\text{s}$	1 sec	29.90 sec	31.7 years		

Figure 6: Growth rates of common functions measured in nanoseconds

### 2.3.1 Dominance Relations

*Take-Home Lesson:* Although esoteric functions arise in advanced algorithm analysis, a small variety of time complexities suffice and account for most algorithms that are widely used in practice.

## 2.4 Working with the Big Oh

### 2.4.1 Adding Functions

$$O(f(n)) + O(g(n)) \longrightarrow O(\max(f(n), g(n)))$$

$$\Omega(f(n)) + \Omega(g(n)) \longrightarrow \Omega(\max(f(n), g(n)))$$

$$\Theta(f(n)) + \Theta(g(n)) \longrightarrow \Theta(\max(f(n), g(n)))$$

### 2.4.2 Multiplying Functions

$$O(c * f(n)) \longrightarrow O(f(n))$$

$$\Omega(c * f(n)) \longrightarrow \Omega(f(n))$$

$$\Theta(c * f(n)) \longrightarrow \Theta(f(n))$$

---

$$O(f(n)) * O(g(n)) \longrightarrow O(f(n) * g(n))$$

$$\Omega(f(n)) * \Omega(g(n)) \longrightarrow \Omega(f(n) * g(n))$$

$$\Theta(f(n)) * \Theta(g(n)) \longrightarrow \Theta(f(n) * g(n))$$

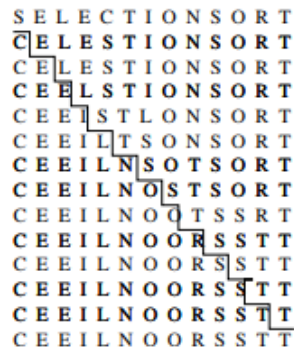

---

### Stop and Think: Hip to the Squares Transitive Experience

*Show that Big Oh relationships are transitive. That is, if  $f(n) = O(g(n))$  and  $g(n) = O(h(n))$ , then  $f(n) = O(h(n))$*

## 2.5 Reasoning About Efficiency

### 2.5.1 Selection Sort

SELECTIONSORT  
CELESTIONSORT  
CELESTIONSORT  
CEEELSTIONSORT  
CEEELSTLONSORT  
CEEELTSONSORT  
CEEELNLSOTTSORT  
CEEELNOSTTSORT  
CEEELNOQTSSRT  
CEEELNOORSSSTT  
CEEELNOORSSSTT  
CEEELNOORSSSTT  
CEEELNOORSSSTT  
CEEELNOORSSSTT  
CEEELNOORSSSTT

Figure 7: Animation of selection sort in action.

```
selection_sort(int s[], int n)
{
    int i, j;          /* counters */
    int min;           /* index of minimum */

    for (i=0; i<n; i++) {
        min=i;
        for(j=i+1; j<n; j++)
            if(s[j] < s[min]) min = j;
        swap(&s[i], &s[min]);
    }
}
```

### 2.5.2 Insertion Sort

```
for (i=1; i<n; i++) {
    j=i;
    while((j>0) && (s[j] < s[j-1])) {
        swap(&s[j], &s[j-1]);
        j = j-1;
    }
}
```

### 2.5.3 String Pattern Matching

*Problem:* Substring Pattern Matching

*Input:* A text string  $t$  and a pattern string  $p$

*Output:* Does  $t$  contain the pattern  $p$  as a substring, and if so where?

Figure 8: Searching for the substring abba in the text aababba

```
int findmatch(char *p, char*t)
{
    int i, j;           /* counters */
    int m, n;           /* string lengths */

    m = strlen(p);
    n = strlen(t);

    for (i=0; i<(n-m); i=i+1) {
        j = 0;
        while((j<m) && (t[i+j] == p[j]))
            j = j + 1;
        if(j ==m) return (i);
    }

    return(-1)
}
```

## 2.5.4 Matrix Multiplication

*Problem:* Matrix Multiplication

*Input:* Two matrices, A (of dimension  $x \times y$ ) and B (dimension  $y \times z$ ).

*Output:* An  $x \times z$  matrix C where  $C[i][j]$  is the dot product of the  $i$ th row of A and the  $j$ th column of B.

## 2.6 Logarithms and Their Applications

$$b^x = y \leftrightarrow x = \log_b y$$

$$b^{\log_b y} = y$$

### 2.6.1 Logarithms and Binary Search

Figure 9: A height  $h$  tree with  $d$  children per node as  $d^h$  leaves. Here  $h = 2$  and  $d = 3$

## 2.6.2 Logarithms Trees

## 2.6.3 Logarithms and Bits

## 2.6.4 Logarithms and Multiplication

$$\log_a(xy) = \log_a(x) + \log_a(y)$$

$$\log_a n^b = b \cdot \log_a n$$

$$a^b = e^{(\ln(a^b))} = e^{(b(\ln(a)))}$$

## 2.6.5 Fast Exponentiation

## 2.6.6 Logarithms and Summations

*Harmonic Numbers:*

$$H(n) = \sum_{i=1}^n \frac{1}{i} \sim \ln(n)$$

## 2.6.7 Logarithms and Criminal Justice

Loss (apply the greatest)	Increase in level
(A) \$2,000 or less	no increase
(B) More than \$2,000	add 1
(C) More than \$5,000	add 2
(D) More than \$10,000	add 3
(E) More than \$20,000	add 4
(F) More than \$40,000	add 5
(G) More than \$70,000	add 6
(H) More than \$120,000	add 7
(I) More than \$200,000	add 8
(J) More than \$350,000	add 9
(K) More than \$500,000	add 10
(L) More than \$800,000	add 11
(M) More than \$1,500,000	add 12
(N) More than \$2,500,000	add 13
(O) More than \$5,000,000	add 14
(P) More than \$10,000,000	add 15
(Q) More than \$20,000,000	add 16
(R) More than \$40,000,000	add 17
(Q) More than \$80,000,000	add 18

Figure 10: The Federal Sentencing Guidelines for fraud

*Take-Home Lesson:* Logarithms arise whenever things are repeatedly halved or doubled

## 2.7 Properties of Logarithms

$$\log_a b = \frac{\log_c b}{\log_c a}$$

### Stop and Think: Importance of an Even Split

*How many queries does binary search take on the million-name Manhattan phone book if each split was 1/3 to 2/3 instead of 1/2 to 1/2?*

## 2.8 War Story: Mystery of the Pyramids

## 2.9 Advanced Analysis (\*)

## 2.10 Esoteric Functions

## 2.11 Limits and Dominance Relations

*Take-Home Lesson:* By interleaving the functions here with those of Section 2.3.1 we see where everything fits into the dominance pecking order:

$$\begin{aligned} n! &\gg c^n \gg n^3 \gg n^2 \gg n^{1+\epsilon} \gg n \cdot \log(n) \gg n \gg \sqrt{n} \\ &\gg \log^2 n \gg \log(n) \gg \frac{\log(n)}{\log(\log(n))} \gg \log(\log(n)) \gg \alpha(n) \gg 1 \end{aligned}$$

# 3 Data Structures

## 3.1 Contiguous vs. Linked Data Structures
